

Deliver More Value with Federated Search

How many discussions have you had in which your clients and potential customers described integrating databases, a CRM system, a supply chain application, a subscription site, internet search engines, multiple CMS applications, and possibly another local search index or two? Felt like you couldn't deliver? Not anymore!

Introducing the Federated Search Toolkit from Raritan Technologies.

Raritan Technologies Federated Search Toolkit can integrate virtually every kind of data source in "real-time" with a set of out-of-the-box connectors and tools.

This suite of tools can add to the power of Enterprise Search by:

- Providing a "real-time" one-stop search Portal to all corporate information including local content plus integration of those sources where content is not easily accessible or indexable.
- Creating a tool to Discover, Categorize and Save information from multiple sources which can then be pushed into a local collection after it has been deemed of value and further enriched by entity extraction, user ratings or categorization technologies.
- Accessing data from many sources or protocols including HTTP/HTML, SOAP, SQL, OpenSearch, Z39.50, Documentum, eRoom or Enterprise Search Engines or Appliances

Raritan Technologies is a technology implementation company specializing in search solutions. We provide software package implementation and custom software development solutions. We have deep expertise in enhancing search capabilities with federated technology, collection and application tuning and development, taxonomy integration, and entity extraction and classification technologies.

Raritan's Search Integration Framework Toolkit (SIFT) provides easy and flexible integration with most of the leading search engine, taxonomy, entity extraction, classification, metadata management, content management, document management, security and relational database software products.

Raritan's Federated customers include Amgen, Bristol-Myers Squibb, GlaxoSmithKline, the IEEE and Pfizer

Please call us to discuss your requirements.

Why Do you need Federation?

- It may not be feasible to re-index all of the content available from large public sites like PubMed or Google.
- You may not have the rights to index the content (e.g. from subscription sites like Ovid, Hoovers, IDDB, Factiva...)
- The content is constantly being updated and it is impractical to keep the data as timely as it needs to be.
- The data may only be available through another search engine and there is no other way to get to the content other than searching it directly.
- An indexing connector may not exist for the source.

Additional Features

The Federated toolkit can respect the security of each source, support Single Sign-On, is configurable via XML and will easily integrate most Enterprise Search Engines. There is support and compliance with J2EE standards. The Federated toolkit provides multi-threading support, is easily extensible (e.g. new sources and protocols can be added rapidly) and also provides tools and utilities which enable customization of results ranking, sorting and categorization. Finally, searches as well as results can be saved across sessions and shared among different user groups.
