

# “Quick Start” Search Application and Collection Builder

Developed by Raritan Technologies

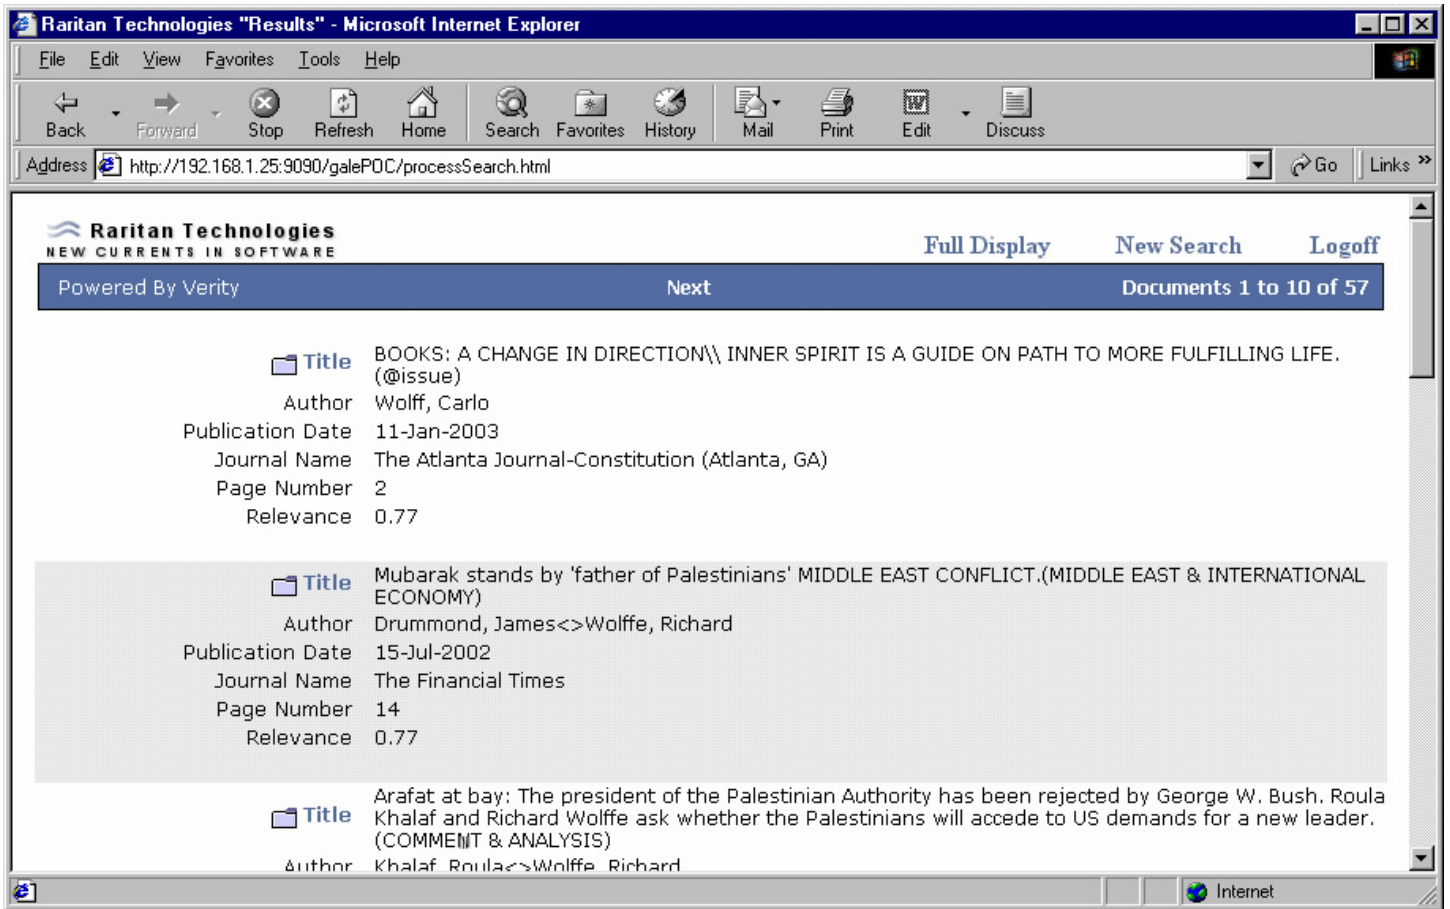

Have you thought about using Verity for your enterprise search application and been intimidated by the time and cost that it will take to develop a full-featured Verity search application? Does your IT staff know how to best take advantage of the powerful Verity Enterprise software? Raritan Technologies has developed an out of the box solution where you can deploy a fully functional web based search application in a matter of days. Our tools (with minimal installation consulting and configuration) will enable you to:

- Define the format of your Verity collections
- Customize your search interface
- Define query expansion criteria (e.g. to support Keyword searching)
- Determine “Brief” and “Full” output displays
- Configure your default sort order.
- Add a customizable security layer to control user access down to individual document fields.

The Collection Builder and Search Application Configuration Manager are fully integrated to build Verity collections from your structured input data. You can define zones, fields, and full text content. You also can define which zones or fields are searchable and/or displayable. The user interface and searching logic are then generated to match your collection setup. Further customization (e.g. Logos, query expansion, result set size, brief and full display controls, simultaneous searching against multiple data sources, logging to enable usage monitoring) is also possible.

## About Raritan Technologies:

**Raritan Technologies** is a full service consulting company specializing in search applications. We provide development, custom software and database solutions. We can provide custom solutions using industry standard software, whether you are a Fortune 500 company or a small independent organization.

The services we provide have many different titles - application development, web development, IT consulting, B2B development. Our specialty is the development of browser based user interfaces to very large and diverse document databases. We are experts in the **Verity** product line, including Federated Technology, Collection and Application Tuning and Development, Taxonomy Integration and Parametric Technology. We also work with document storage technology, including Documentum, Oracle and other relational databases.
